

## **Development of a simple Artificial Intelligence**

To understand the basic concepts of Python and Artificial Intelligences, we were tasked to code a simple AI, that gets information from the user, typed through the keyboard and then display it at the end of the run. The program also responds to instances when the user does not want to introduce certain data, and elides them, instead of crashing the whole thing.

It's important to point out that this is just a graze into what AI is, since during our courses, we will learn more about how a fully fleshed AI would respond and learn from various kinds of data inputs.
